RECURSION

BY SANJAY AND ARVIND SESHAN

LESSON OBJECTIVES

- Learn how to create recursive functions

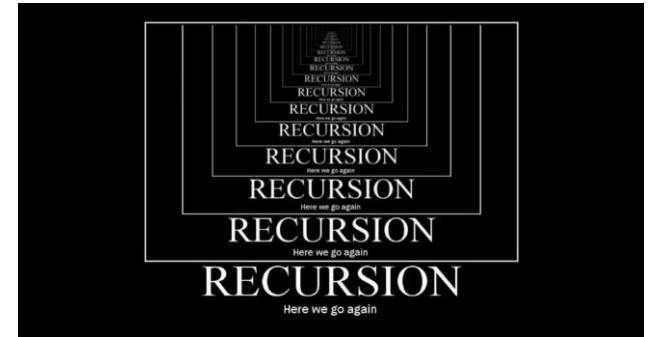

INTRO TO RECURSION

- Definition recursion (n):
 - see recursion
- The definition refers to itself (like a loop)
- Some famous examples are:

- Fibonacci series: $f_n = f_{n-1} + f_{n-2}$

- Factorial: $n! = n * (n - 1)!$

- In Python: a function that calls itself

$$1, 1, 2, 3, 5, 8, 13, \dots$$

$$5! = 5 * (4 * (3 * (2 * (1)))) = 120$$

PROGRAMMING A RECURSIVE FUNCTION

- There are two parts to recursion:
 - The base case → a known case
 - Sometimes there are multiple base cases
 - The recursive case → everything else

```
def recursiveFunction():  
    if (this is the base case):  
        return something non-recursive  
    else:  
        return something recursive
```

RECURSION: FACTORIAL

- Base Case: $\text{factorial}(1) = 1$ (i.e. $1! = 1$)
- Recursive case: $\text{return } n * (\text{factorial}(n-1))$

```
def factorial(n):  
    if (n == 1):  
        return 1  
    else:  
        return n*factorial(n-1)
```

RECURSION: FIBONACCI

- Base Case 1: $\text{fibonacci}(1) = 1$
- Base Case 2: $\text{fibonacci}(2) = 1$
- Recursive case: $\text{return fibonacci}(n-1) + \text{fibonacci}(n-2)$

```
def fibonacci(n):  
    if (n == 1):  
        return 1  
    elif (n == 2):  
        return 1  
    else:  
        return fibonacci(n-1) + fibonacci(n-2)
```

CHALLENGE: PELL SEQUENCE

- Create a recursive function to get the nth value in the Pell sequence
- The Pell sequence is 0, 1, 2, 5, 12, 29, 70, 169, 408, 985,
- Mathematically, it is defined as

$$P_n = 2 * P_{n-1} + P_{n-2}$$

- Print the 5th PELL number to the light matrix

CHALLENGE SOLUTION

```
def PELL(n):  
    if (n==1):  
        return 0  
    elif (n==2):  
        return 1  
    else:  
        return 2*PELL(n-1)+PELL(n-2)
```

```
hub.light_matrix.write(PELL(5))
```
